

Using SDISKW

To create the system disk, simply drag the .out file of the system you wish to create to the "sdiskw.exe" icon. This should open the SDiskW program. Insert the appropriate floppy disk into the A: drive of the computer and click "Write" in the SDiskW application. The system disk should begin to be written.

If you get a "Couldn't continue, invalid size of diskimage!" error, you need to insert a High Density Disk.

If you get a "Floppy is not formatted as DD(Double Density/720kB)! Error, you need to insert a Double Density Disk.
